

SNT needs help

During the transportation of servers, SNT has accidentally dropped servers on campus! Luckily, the servers are equipped with an emergency rescue feature. If they haven't been connected via ethernet to a network, it connects to the nearest open Wi Fi network and pings the SNT rescue-server. Since IPs can also indicate a location, we can use these to find the servers! The rescue-server reports the following addresses: `::ffff:34ef:6305` and `::ffff:8259:a2c3`.
